

# Valuation Volatility

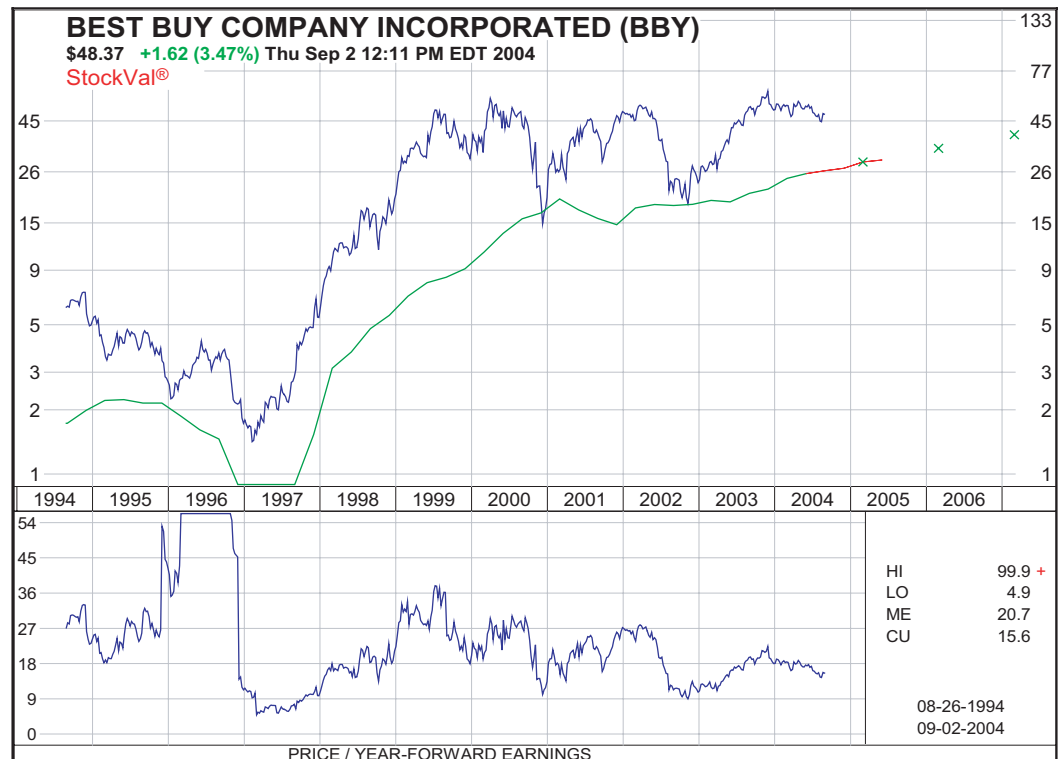

## Tracking Intraday Valuation Multiples using StockVal

In a single trading day, a price related valuation metric swings up and down due to the most notable factor, price. StockVal now introduces a twenty minute delayed price quote which will allow for seamless valuation metric updates throughout the StockVal graphing facilities. With the availability of this feature, the user will be able to track valuation levels intraday and evaluate these values to historical median levels.

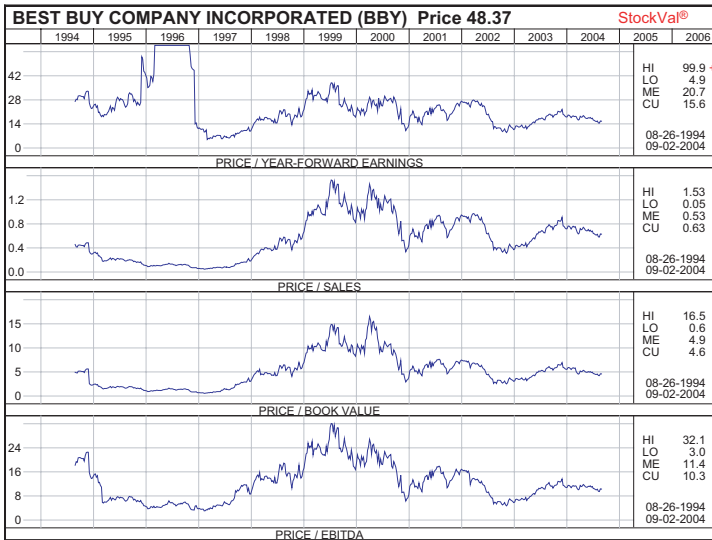

### ABOUT STOCKVAL

Since 1985, StockVal has offered comprehensive equity analysis and portfolio management tools to the investment management community through distinctive software and database products.

With the Intraday Pricing turned on, a date stamp will be visible atop the Price and Earnings graph which allows the user to view the dollar and percent change as well as the time and date.

Here on the bottom panel graph, the current Price / Earnings metric has been updated using the intraday pricing which shows the multiple moving closer to the ten year median.

Some other examples where the user can track valuation changes are within the Custom Graph facilities. Using the custom graph facility, the user can view several intraday valuation measures and will be able to quickly compare intraday valuation levels with the respective historical medians.

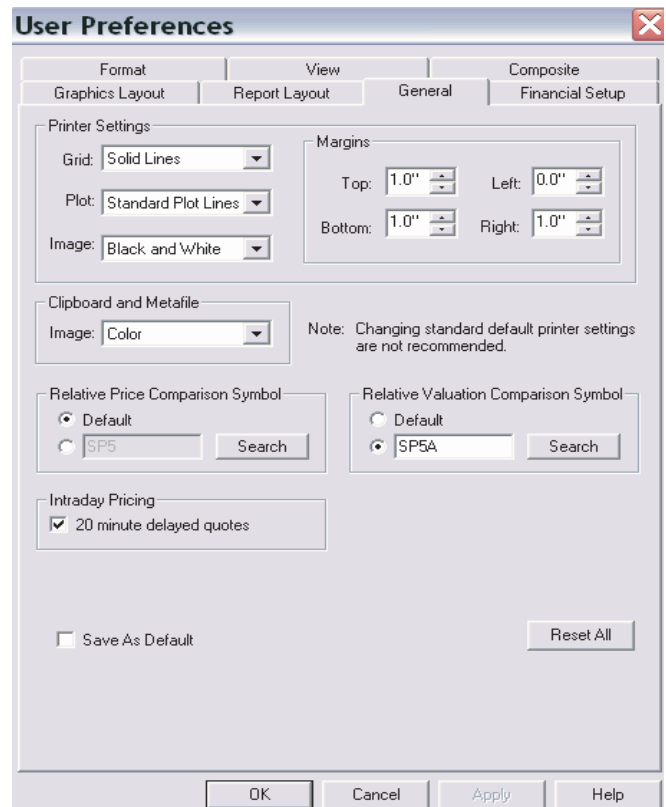

The user can turn on Intraday Pricing in User Preferences under the File pull down menu.

Note: In order for Intraday Pricing to be readily available for each session, check the Save As Default box.
